MRI LUMBO-SACRAL SPINE

Study Protocols:

Non-contrast MR imaging of lumbo-sacral spine performed in sagittal, coronal and axial planes with SE, TSE & STIR sequences to obtain T1W and T2W images. Flow compensation techniques employed to reduce flow artifacts.

Straightening of lumbar spine is seen with loss of lordotic curvature.

Mildly reduced bone density is seen in region under view with subtle shallow endplate depressions at few levels suggesting mild bone weakening.

Visualized vertebral bodies and posterior spinal elements otherwise grossly appear normal in contours and marrow signal with subtle focal marrow fatty changes/lipid rests at few levels. No definite obvious focal osseous mass lesion is seen on non-contrast imaging in region under view.

Intervertebral discs and disc spaces appear relatively preserved.

Mild posterior-foraminal disc bulge is seen at L2-S1 levels minimally obliterating anterior subarachnoid space and along with subtle ligamentum flavum hypertrophy/ buckling is causing thecal sac indentation with neural foraminal compromise and subtle compression-impingement on exiting nerve roots relatively more apparent at L4-5 and L5-S1 levels.

Lumbar bony canal grossly appears normal with no obvious primary canal stenosis or any intra or extradural mass lesion.

Visualized distal spinal cord & conus regions and cauda equina nerve roots grossly appear normal with no obvious extrinsic compression or abnormal intramedullary signal alteration.

No obvious perivertebral soft tissue or epidural space loculated collection is apparent in region under view on non-contrast imaging at time of study.

Impression:

- **Mild posterior disc bulge & subtle compression-impingement on exiting nerve roots at L2-S1 levels relatively more apparent at L4-5 & L5-S1 levels, with details as above.**
- **No definite obvious focal osseous mass lesion-marrow edema or any perivertebral soft tissue loculated collection is apparent in visualized region at time of study.**

Please correlate clinically.

This is a professional opinion based on imaging findings and not the diagnosis. It should be correlated clinically and with other relevant investigations to arrive at a proper conclusion. Not valid for medico-legal purposes.
